Part A Checkpoint question:

The comment works like a natural-language list of the controls you want to generate. Tab follows that intent and fills in the matching HTML piece by piece.

Reflection 1:

Typo:

Tab or inline edit: it’s a one-line change.

Rename a variable in one function:

Inline edit: select that function and describe the rename.

Understand someone else’s code:

Ask with @-mentions: read-only explanations without editing files.

Add a whole new feature:

Agent: multi-step work across files, then review the diff and test manually.

Reflection 2:

Name one thing the AI did that you had to check or correct:

I had to manually verify rounding to two decimal places and error handling for edge cases like empty bill, zero or missing people.
